Mr. Norbert Artz, Box 313, Augusta, MT 59410

Ladies and Gentlemen:

Please find enclosed an Environmental Assessment prepared for a Future Fisheries Project tentatively planned to stabilize 2,100 feet of stream channel on three reaches of Elk Creek (So. Fork of Sun River). This proposed project is located approximately 1 mile northeast of the town of Augusta in Lewis and Clark County.

Please submit any comments that you have by 5 P.M., October 12, 1999 to the Department of Fish, Wildlife and Parks in Helena at the address listed above. Completion of this project is contingent upon approval being granted by the Fish, Wildlife and Parks Commission. If you have any questions, feel free to contact me at (406) 444-2432.

Sincerely,

Mark Lere, Program Officer  
Habitat Protection Bureau  
Fisheries Division

ENVIRONMENTAL ASSESSMENT  
Fisheries Division  
Montana Fish, Wildlife and Parks  
Elk Creek Channel Restoration Project

General Purpose: The 1995 Montana Legislature enacted statute 87-1-272 through 273 which directs the Department to administer a Future Fisheries Improvement Program. The program involves physical projects to restore degraded fish habitat in rivers and lakes for the purpose of improving wild fisheries. The legislature established an earmarked funding account to help accomplish this goal. This project is being proposed to restore a total of 2,100 feet of stream channel on Elk Creek (South Fork of the Sun River). Elk Creek is a spawning and rearing tributary for brown trout and rainbow trout migrating from the main stem of the Sun River. The stream also maintains resident populations of these two species of trout. The project site, involving a single property owner, is located approximately 1 mile northeast of the town of Augusta in Lewis and Clark County (Attachment 1).

I. Location of Project: This project will be conducted on Elk Creek (So. Fork of the Sun River) located approximately 1 mile northeast of the town of Augusta within Township 20 North, Range 6 West, Section 10 in Lewis and Clark County.

II. Need for the Project: Department Goal C indicates that a Fisheries Division objective is to "provide and support programs to conserve and enhance high quality aquatic habitat and protect native aquatic species." The Future Fisheries Improvement Program is a tool to help achieve that objective.

Elk Creek has been degraded by past stream management practices, including overgrazing by livestock within the riparian corridor. This past activity has resulted in accelerated bank erosion; resulting in channel degradation, potential meander cut-offs and poor fish habitat. This project proposes to stabilize a total of 2,100 feet of stream channel, including a potential meander cut-off, by adjusting channel morphology through narrowing and realigning portions of the channel, reconstructing pools and planting willow and other native shrubs within the riparian corridor. Eroding stream banks will be stabilized by sloping and shaping, installing root wads and tree revetment, and planting native shrubs along the margin of the channel. The project is intended to compliment previous work completed in the Elk Creek watershed.

III. Scope of the Project:

The proposal calls for stabilizing approximately 2,100 feet of stream channel on three reaches of Elk Creek. The proposed work would involve adjusting the morphology of the channel by constructing proper channel curvature and channel dimensions; installing root wads and tree revetments on eroding banks; and planting native shrubs along the channel margins. In addition, fencing will be installed to protect newly treated sites from livestock grazing. This project is expected to cost \$18,000.00. Of this total, the Future Fisheries Improvement Program would be contributing up to \$7,500.00.

IV. Environmental Impact Checklist:

Please see attached checklist.

V. Explanation of Impacts to the Physical Environment

1. Terrestrial and aquatic life and habitats.

Stabilizing the existing channel and preventing a potential meander cut-off is expected to create a more healthy habitat for aquatic life by maintaining channel length and reducing sediment input. Expected improvements in the aquatic habitat should enhance both resident trout populations in the stream and migrant populations from the main stem of the Sun River. Habitat for riparian dependent wildlife would also be improved by enhancing the riparian vegetative community through the planting of willow and other native shrubs along the stream margin.

2. Water quantity, quality and distribution.

Short term increases in turbidity will occur during project construction. To minimize turbidity, construction will occur during a low flow period and operation of equipment in the stream channel will be minimized to the extent practicable. The intent is to divert as much of the stream as possible into a meander cut-off during construction to allow work to be conducted in the dry. The Department of Environmental Quality will be contacted to determine narrative conditions required to meet short-term water quality standards and protect aquatic biota. A 310 permit will be obtained from the local Conservation District. In the long term, stabilizing the existing channel would reduce the sediment contribution to downstream areas, thereby improving the overall quality of downstream waters.

3. Geology and soil quality, stability and moisture.

Soils along the stream margin would be disturbed by sloping back cut-banks and by the installation of root wads, but would stabilize quickly following proposed re-vegetation efforts. Overall, the project is expected to reduce bank erosion and improve channel stability.

4. Vegetation cover, quantity and quality.

Riparian vegetation and cover would be improved by creating a more stable stream channel and by planting willow and other native shrubs along the stream corridor.

5. Aesthetics.

Aesthetics would be enhanced by restoring an unstable reach of stream to a more healthy

and natural stream environment. Approximately 2,100 feet of stream channel would be stabilized through proper channel re-alignment and the installation of root wads or tree revetment on eroding meander bends. The riparian vegetative community would be enhanced by planting willow and other native shrubs along the margins of the channel.

9. Historic and archaeological sites

The proposed project will likely require an individual Army Corp of Engineers 404 permit. Therefore, the State Historic Preservation Office has been contacted to determine the need for compliance with the federal historic preservation regulations. The project will not begin until a cultural clearance is granted.

VI. Explanation of Impacts on the Human Environment.

7. Access to & quality of recreational activities.

It is anticipated that the stabilization of 2,100 feet of Elk Creek would improve overall aquatic habitat and, as a result, would enhance trout populations residing in the stream. Migrant trout populations from the main stem of the Sun River also would be expected to be enhanced. Consequently, the recreational fishery in both Elk Creek and the Sun River would be expected to be improved. Fishing access is provided to the public by permission from the landowner.

VII. Discussion and Evaluation of Reasonable Alternatives.

1. No Action Alternative

If no action is taken, this segment of Elk Creek will remain unstable. This ongoing instability will result in continued bank erosion, excessive sediment loading and the loss of fish habitat. If a meander cut-off is allowed to proceed, the channel would be reduced in length by about 400 feet. This loss of channel length, in conjunction with an over-steepened slope, would result in accelerated channel instability. Recreational opportunities associated with fish and wildlife resources will remain reduced and aesthetics will continue to be impaired.

2. The Proposed Alternative

The proposed alternative is designed to stabilize the stream channel on three stream reaches by stabilizing a meander cut-off, shaping banks, installing root wads and tree revetment, and planting native shrubs. These activities would reduce sediment loading, resulting in a more healthy habitat for aquatic life. Planting native shrubs along the stream margin would create more diverse habitat for riparian dependent wildlife. This alternative would improve fish and wildlife habitat, aesthetics and water quality within the project area and would be expected to increase trout populations in both Elk Creek and the main stem of the Sun River.

VIII. Environmental Assessment Conclusion Section

1. Is an EIS required? No.

We conclude from this review that the proposed activities will have a positive impact on the physical and human environment.

2. Level of public involvement.

The proposed project was reviewed and supported by the public review panel of the Future Fisheries Improvement Program. The proposed project also will be reviewed by the Fish, Wildlife and Parks Commission and will be contingent upon their approval. The Environmental Assessment (EA) is being distributed to all individuals and groups listed on the cover letter. The EA will be published on the Montana Electronic Bulletin Board.

3. Duration of comment period?

Public comment will be accepted through 5 P.M. on October 12, 1999.

4. Person responsible for preparing the EA.
